

ABSTRACT

A printer system adjusts the color gamut available for print jobs based on consumable conditions in a print device. When a non-optimal consumable condition is detected, such as an empty toner color, the printer system offers options for managing the non-optimal consumable condition. One option permits a user to select an alternate color scheme and have the print job resubmitted to the print device for printing with the alternate scheme. The alternate color scheme avoids the non-optimal consumable condition by not using the toner color affected by that condition.
